Plant "Mood" Plants with weeds around them or who go without water a while will begin to degrade and cease growth. If it drops too low too long, the plant will die. Keeping your plants good 'mood' will allow you to evolve them. There is a certain time a plant must be happy, reduced by fertilizer, before it can evolve.

One of the main roles of peripheral proteins is to direct and maintain both the intracellular cytoskeleton and components of the extracellular matrix. Both of these structures are formed by a series of organelles, filaments, and tubules. These small structures can provide rigidity or tension, but they need something to attach to.
