Transcriptomics technologies are the techniques used to study an organism's transcriptome, the sum of all of its RNA transcripts. The information content of an organism is recorded in the DNA of its genome and expressed through transcription. Here, mRNA serves as a transient intermediary molecule in the information network, whilst non-coding RNAs perform additional diverse functions.

The scan cells are linked together into "scan chains" that operate like big shift registers when the circuit is put into test mode. The scan chains are used by external automatic test equipment (ATE) to deliver test pattern data from its memory into the device. After the test pattern is loaded, the design is placed back into functional mode and the test response is captured in one or more ...
