*Just-in-time compilers are a combination of AOT compilers and interpreters. After a Java program is written, the JIT compiler turns the code into bytecode rather than into code that contains instructions for a specific hardware platform's processor. The bytecode is platform independent and can be sent and run on any platform that supports Java.*

*In languages like Lox that use IEEE 754 double-precision floating-point numbers, the first evaluates to 0.006, while the second yields 0.006000000000000001.Sometimes that tiny difference matters. This is a good place to learn more.. All of this is correct, but the fact that the first symbol in the body of the rule is the same as the head of the rule means this production is left-recursive.*
